

The Warnerbus Driver Protection Screen

We are all aware that attacks made against drivers of minibuses, private hire and taxi vehicles are becoming more common by the day.

Warnerbus can offer you or your organisation a driver protection screen which has been designed and rigorously tested to provide the driver with protection in the event of a passenger becoming violent or disruptive.

- * The Driver Safety Shield protects both the driver and front passenger- preventing physical contact from behind.

- * The Protection Screen system is particularly flexible; no special tools are needed and it only takes a few minutes with a spanner to fit them.

- * Driver Protection Screens can be removed and fitted to a different vehicle just as quickly, making them a unique long-term investment in your safety. When you replace your vehicle simply move your screen to your new vehicle.

Driving Quality... ..

The Warnerbus Driver Protection Screen

Testing

- Design of the current model of shield has been made using the best features from earlier models used in other countries; with improvements and use of latest technology.
- The manufacturer has a long experience of supplying shields in Canada and the U.S. where a need for this equipment has existed for many years. This experience has been invaluable in designing the best type of shields for use in the U.K. and these designs have been accepted and registered with the appropriate E.U. authority.
- The Driver Protection Screens are made from 6mm tough clear polycarbonate, vacuum moulded and shaped to fit around the full width of the seatback following the contour of the inside of the door pillar. Shields are full length (90cm - 36") finishing at the bottom of the driver's seat and do not impede footwell space. There is a reinforced rubber covered steel edging around the shield.
- The mounting hardware consists of brackets, three nuts and bolts which allows the shield to be secured in place with a 13mm spanner.
- The brackets can be adjusted vertically and horizontally in order to ensure that the shield is mounted correctly. A tension adjustment strap is located at the lower edge of the shield to ensure that it is held firmly in place. Fittings takes only a few minutes. There is nothing visible on the rear of the fitted shield which can be interfered with by a back seat passenger.
- Various manufacturers and professional testing has been carried out on the shield which includes a MIRA vehicle crash body test. This conforms to Regulation ECE 17 Annex 6 Impacts testing.

The Screens are available for Driver or Passenger protection, with or without an added side panel.

We can arrange to despatch the Driver Protection Screen directly to you or, alternatively, Warnerbus can fabricate and fit the shield to your vehicle.

Please do not hesitate to contact us to discuss your requirements further.
